

**Listing of Claims:**

1. (Previously Presented) A lamp apparatus for a liquid crystal display, comprising:  
a lamp capable of using a discharge of an external voltage applied to an electrode of  
the lamp to generate light;

a wire to deliver the external voltage;

a connector for electrically connecting the electrode of the lamp to the wire, the  
connector directly contacting the electrode of the lamp and a portion of the wire; and

unifying means for integrally forming the lamp and the wire electrically connected to  
each other via the connector.

2. (Original) The lamp apparatus according to claim 1, further comprising a unifying  
means for integrally forming the power terminal of the lamp and the wire electrically  
connected to each other via the connector.

3. (Original) The lamp apparatus according to claim 1, wherein the connector  
includes:

a first curved wing for directly contacting the electrode of the lamp; and

a second curved wing for directly contacting a portion of the wire.

4. (Original) The lamp apparatus according to claim 2, wherein the unifying means is an injection molded product for unifying an end of the lamp, the electrode of the lamp, the connector, and the wire.

5. (Original) The lamp apparatus according to claim 4, wherein a material of the injection molded product is selected from any one of the group comprising plastic and silicon.

6. (Original) The lamp apparatus according to claim 3, wherein the first curved wing is at least partially surrounding the electrode of the lamp and the second curved wing is at least partially surrounding the portion of the wire.

Claims 7-12 (Canceled)

13. (New) A apparatus, comprising:

a device having an electrode;

a wire;

a connector including electrically conductive material, wherein the connector directly contacts the electrode and the wire.

14. (New) The apparatus of claim 8, further including a holder that protects a portion of the device and a portion of the wire from external impacts.

15. (New) The apparatus of claim 9, wherein the holding includes injection molded material.

16. (New) The apparatus of claim 8, wherein the connector includes:  
a first curved portion directly contacting the electrode; and  
a second curved portion directly contacting the wire.

17. (New) The apparatus of claim 11, wherein the first curved portion at least partially surrounds the electrode and the second curved portion at least partially surrounds a portion of the wire.
